KEY SKILLS

Networking:
Cisco Switching & Routing, VLANs, QoS, VPN, Load Balancing

Security:
Zero Trust, SOC & SIEM, IDS/IPS, Firewall Configuration

Systems Admin:
Linux (Ubuntu, CentOS), Windows Server, Virtualization

Automation:
Python for Networking, Bash Scripting, Ansible

Teaching:
Academic Tutoring, Professional Training, Student Guidance

TOOLS & TECHNOLOGIES

Software & Platforms:
Cisco Packet Tracer, GNS3, Proxmox, VMware, Docker, FortiGate, pfSense, Wireshark, Nmap

Security & Monitoring:
Suricata, Snort, Security Onion, Zeek

Hardware:
Cisco Routers & Switches, Dell Switches

LANGUAGES

- Arabic (Native)
- French (Fluent)
- English (Professional)

GITHUB

github.com/Selmi-Firas

PROFILE

Network and Security Engineer with hands-on experience in system administration, network infrastructure, and security monitoring across live production environments. Deployed and managed 90+ VM environments, automated multi-machine workflows cutting deployment time by over 95%, and implemented IDS/IPS and SIEM solutions for real-time threat visibility. Skilled in Ansible, Python, and Linux/Windows administration. Currently pursuing an M.S. in Cybersecurity at GVSU with a research focus on quantum networking and SDN.

EDUCATION

Master of Science in Cybersecurity	Sep 2025 – Present
Grand Valley State University (GVSU), Michigan, USA	
Master (M1) in Cyber-Physical Systems	Oct 2024 – May 2025
Higher Institute of Applied Sciences and Technology of Mateur, Tunisia	
Bachelor in Network and Systems Engineering	Oct 2019 – May 2023
Higher Institute of Applied Sciences and Technology of Mateur, Tunisia	

WORK EXPERIENCE

Systems & Network Administrator (Graduate Assistant)	Sep 2025 – Present
Grand Valley State University (GVSU) Allendale, Michigan	
- Administer and maintain 1 Linux server hosting 12+ VMs alongside 30 Windows workstations, ensuring high availability for 4–5 classes serving 20+ students each per week - Deploy and manage 30 VirtualBox instances each running 3+ VMs, maintaining a 90+ VM virtual environment for academic lab use - Automated file transfers and application deployment across 30 Windows machines using Ansible, eliminating manual configuration errors and ensuring 100% consistent environment setup across all endpoints - Serve as sole IT support for 4–5 concurrent classes weekly, resolving hardware, software, and network issues with no escalation path	
Network Infrastructure & Systems Administrator	Jun 2023 – May 2024
Tunis, Tunisia	
- Managed network infrastructure for a ~35-machine environment across 4 servers, supporting 30–40 users across a single-site office with occasional multi-site support - Architected and implemented VLAN segmentation, splitting the network into 2 VLANs to isolate intern traffic from employee systems, improving security posture - Enforced acceptable use policies using IDS/IPS monitoring, reducing non-work-related web activity and improving productivity across the organization - Deployed and operated SOC & SIEM platforms providing real-time security monitoring across 30–40 endpoints and 4 servers - Extended support to partner sites, diagnosing and resolving network and systems issues across multiple locations - Executed all security and network projects on live production infrastructure, gaining hands-on experience in real-world risk management	

PROJECTS

Network Monitoring & SOC Lab Deployment
- Deployed and configured a full SOC environment using Security Onion integrating Zeek, Suricata, and Snort on live production network infrastructure - Simulated and analyzed real enterprise network traffic to identify suspicious behavior and validate IDS/IPS detection rules - Established a centralized logging pipeline aggregating logs from 3 IDS/IPS tools, enabling full packet-level inspection across all monitored endpoints
Automated Network Deployment (Ansible)
- Engineered Ansible playbooks from scratch to handle multi-machine configuration, cutting deployment time from 5–6 hours to under 1 hour for large operations and from ~1 hour to 30 seconds for standard tasks - Structured reusable playbook roles for software installation, file transfer, and system configuration across 30 heterogeneous Windows endpoints - Reduced human error rate to near-zero by replacing manual processes with fully scripted, repeatable deployment pipelines
SDN-Based Network Simulation (Mininet & ONOS)
- Built and simulated multi-node software-defined network topologies using Mininet, replicating real-world routing scenarios - Leveraged ONOS controller to programmatically manage flow tables and measure network behavior under
